

第二章矩阵代数

第五节 分块矩阵

§ 2.5.1 分块矩阵及其运算

一、矩阵的分块

对于行数和列数较高的矩阵A,为了简化运算,经常采用分块法,使大矩阵的运算化成小矩阵的运算。

具体做法:将矩阵A用若干条纵线和横线分成许多个小矩阵,每一个小矩阵称为A的子块,以子块为元素的形式上的矩阵称为分块矩阵。

即

例
$$A = egin{pmatrix} a & 1 & 0 & 0 \ 0 & a & 0 & 0 \ 1 & 0 & b & 1 \ 0 & 1 & 1 & b \end{pmatrix} = egin{pmatrix} B_1 \ B_2 \ B_3 \end{pmatrix},$$

$$A = \begin{bmatrix} a & 1 & 0 & 0 \\ 0 & a & 0 & 0 \\ 1 & 0 & b & 1 \\ 0 & 1 & 1 & b \end{bmatrix} = \begin{bmatrix} B_1 \\ B_2 \\ B_3 \end{bmatrix}$$

$$A = \begin{pmatrix} a & 1 & 0 & 0 \\ 0 & a & 0 & 0 \\ 1 & 0 & b & 1 \\ 0 & 1 & 1 & b \end{pmatrix} = \begin{pmatrix} C_1 & C_2 \\ C_3 & C_4 \end{pmatrix},$$

$$\mathbb{P} \qquad A = \begin{pmatrix} a & 1 & 0 & 0 \\ 0 & a & 0 & 0 \\ 1 & 0 & b & 1 \\ 0 & 1 & 1 & b \end{pmatrix} = \begin{pmatrix} C_1 & C_2 \\ C_3 & C_4 \end{pmatrix}$$

$$A = \begin{pmatrix} a & 1 & 0 & 0 \\ 0 & a & 0 & 0 \\ 1 & 0 & b & 1 \\ 0 & 1 & 1 & b \end{pmatrix} = (A_1 \quad A_2 \quad A_3 \quad A_4), \text{ ##} \text$$

二、分块矩阵的运算规则

(1)设A, B为同型矩阵,采用相同的分块法,有

$$A = egin{pmatrix} A_{11} & \cdots & A_{1r} \\ \vdots & & \vdots \\ A_{s1} & \cdots & A_{sr} \end{pmatrix}, \ B = egin{pmatrix} B_{11} & \cdots & B_{1r} \\ \vdots & & \vdots \\ B_{s1} & \cdots & B_{sr} \end{pmatrix}$$

其中Aij与Bij为同型矩阵,那末

$$A + B = \begin{bmatrix} A_{11} + B_{11} & \cdots & A_{1r} + B_{1r} \\ \vdots & & \vdots \\ A_{s1} + B_{s1} & \cdots & A_{sr} + B_{sr} \end{bmatrix}.$$

即:
$$(A_{ij})_{sr} + (B_{ij})_{sr} = (A_{ij} + B_{ij})_{sr}$$

は (2) 设
$$A = \begin{pmatrix} A_{11} & \cdots & A_{1r} \\ \vdots & & \vdots \\ A_{s1} & \cdots & A_{sr} \end{pmatrix}$$
 , λ 为数, 那末
$$\lambda A = \begin{pmatrix} \lambda A_{11} & \cdots & \lambda A_{1r} \\ \vdots & & \vdots \\ \lambda A_{s1} & \cdots & \lambda A_{sr} \end{pmatrix}$$
 即: $\lambda (A_{ij})_{sr} = (\lambda A_{ij})_{sr}$

$$\lambda A = egin{pmatrix} \lambda A_{11} & \cdots & \lambda A_{1r} \\ \vdots & & \vdots \\ \lambda A_{s1} & \cdots & \lambda A_{sr} \end{pmatrix}.$$

即:
$$\lambda(A_{ij})_{sr} = (\lambda A_{ij})_{sr}$$

(3)设A为 $m \times l$ 矩阵,B为 $l \times n$ 矩阵,分块成

$$A = \begin{pmatrix} A_{11} & \cdots & A_{1t} \\ \vdots & & \vdots \\ A_{s1} & \cdots & A_{st} \end{pmatrix}, \quad B = \begin{pmatrix} B_{11} & \cdots & B_{1r} \\ \vdots & & \vdots \\ B_{t1} & \cdots & B_{tr} \end{pmatrix},$$

其中 $A_{i1}, A_{i2}, \dots, A_{ii}$ 的列数分别等于 $B_{1j}, B_{2j}, \dots, B_{ij}$

$$AB = \begin{pmatrix} C_{11} & \cdots & C_{1r} \\ \vdots & & \vdots \\ C_{s1} & \cdots & C_{sr} \end{pmatrix}$$

其中
$$C_{ij} = \sum_{k=1}^{t} A_{ik} B_{kj}$$
 $(i = 1, \dots, s; j = 1, \dots, r).$ 即 $(A_{ij})_{st} (B_{ij})_{tr} = (C_{ij})_{sr} = \left(\sum_{k=1}^{t} A_{ik} B_{kj}\right)_{sr}$

$$(4) 设 A = \begin{pmatrix} A_{11} & \cdots & A_{1r} \\ \vdots & & \vdots \\ A_{s1} & \cdots & A_{sr} \end{pmatrix}, \quad \mathbf{M} \mathbf{A}^{T} = \begin{pmatrix} \mathbf{A}^{TT}_{111} & \cdots & \mathbf{A}^{T}_{s11} \\ \vdots & & \vdots \\ \mathbf{A}^{T}_{1r} & \cdots & \mathbf{A}^{TT}_{srr} \end{pmatrix}.$$

(5)设A为n阶矩阵,若A的分块矩阵只有在主对角线

上有非零子块,其余子块都为零矩阵,且非零子块都

是方阵.即

其中 A_i (i=1,2,...s)都是方阵,那末称A为分块对角矩阵. 记做 $diag(A_1,A_2,...,A_s)$. (准对角阵)

分块对角矩阵的行列式具有下述性质:

$$|A| = |A_1| |A_2| \cdots |A_s|.$$

$$(6)$$
设 $A = \begin{bmatrix} A_1 & O & \\ & A_2 & \\ O & \ddots & \\ & & A_s \end{bmatrix}$

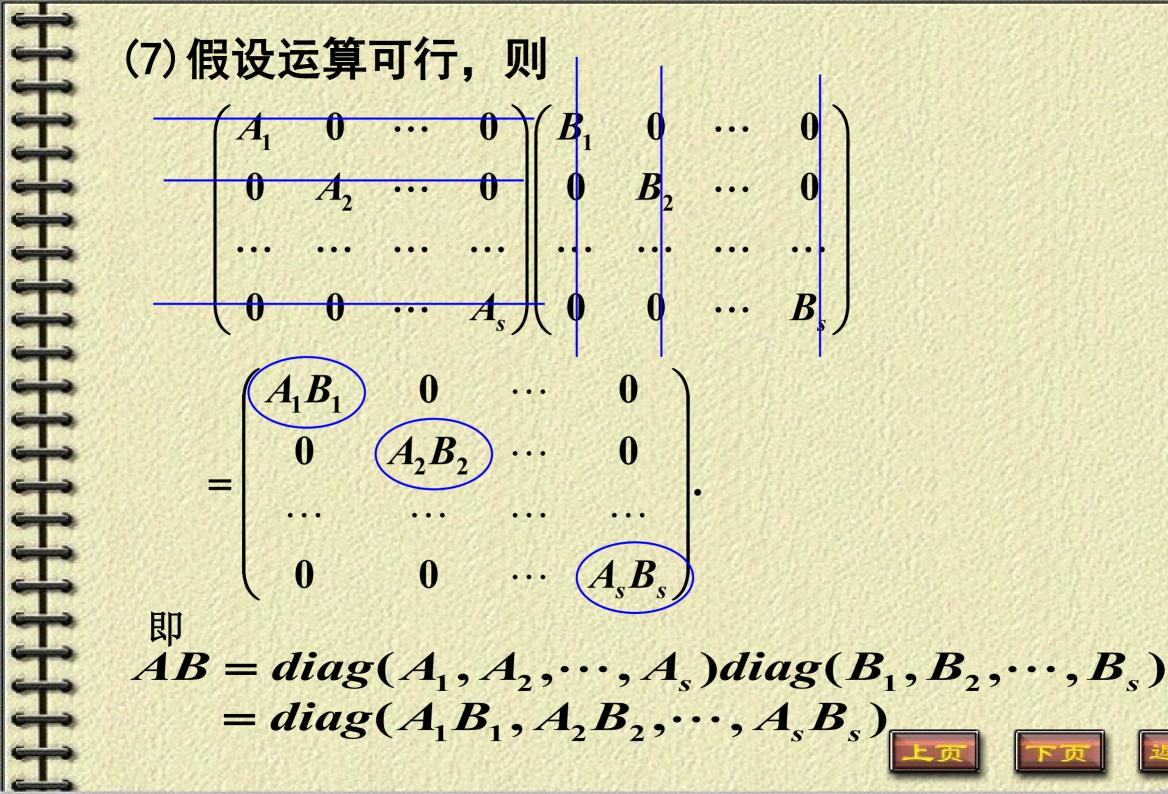

若
$$|A_i| \neq 0 (i = 1, 2, \dots, s)$$
,则 $A \neq 0$,并有

即
$$A^{-1} = diag(A_1^{-1}, A_2^{-1}, \dots, A_s^{-1})$$

例1 设

$$A = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ -1 & 2 & 1 & 0 \\ 1 & 1 & 0 & 1 \end{pmatrix}, \quad B = \begin{pmatrix} 1 & 0 & 1 & 0 \\ -1 & 2 & 0 & 1 \\ 1 & 0 & 4 & 1 \\ -1 & -1 & 2 & 0 \end{pmatrix},$$

求 AB.

$$B = \begin{pmatrix} 1 & 0 & 1 & 0 \\ -1 & 2 & 0 & 1 \\ 1 & 0 & 4 & 1 \\ -1 & -1 & 2 & 0 \end{pmatrix} = \begin{pmatrix} B_{11} E \\ B_{21} B_{22} \end{pmatrix}$$

$$AB = \begin{pmatrix} B_{11} & E \\ A_1B_{11} + B_{21} & A_1 + B_{22} \end{pmatrix}.$$

$$(-1 \ 2)(1)$$

$$= \begin{pmatrix} -3 & 4 \\ 0 & 2 \end{pmatrix} + \begin{pmatrix} 1 & 0 \\ -1 & -1 \end{pmatrix} = \begin{pmatrix} -2 & 4 \\ -1 & 1 \end{pmatrix},$$

$$A_1 + B_{22} = \begin{pmatrix} -1 & 2 \\ 1 & 1 \end{pmatrix} + \begin{pmatrix} 4 & 1 \\ 2 & 0 \end{pmatrix} = \begin{pmatrix} 3 & 3 \\ 3 & 1 \end{pmatrix},$$

于是

$$AB = \begin{pmatrix} B_{11} & E \\ A_1B_{11} + B_{21} & A_1 + B_{22} \end{pmatrix}$$

$$= \begin{pmatrix} 1 & 0 & 1 & 0 \\ -1 & 4 & 0 & 1 \\ -2 & 4 & 3 & 3 \\ -1 & 1 & 3 & 1 \end{pmatrix}.$$

例2 设
$$A = \begin{bmatrix} a & 1 & 0 & 0 \\ 0 & a & 0 & 0 \\ 0 & 0 & b & 1 \\ 0 & 0 & 1 & b \end{bmatrix}$$

$$B = \begin{pmatrix} a & 0 & 0 & 0 \\ 1 & a & 0 & 0 \\ 0 & 0 & b & 0 \\ 0 & 0 & 1 & b \end{pmatrix}$$

求 A+B, ABA.

将A,B分块

解
 将 A, B分块

$$A = \begin{bmatrix} a & 1 & 0 & 0 \\ 0 & a & 0 & 0 \\ \hline 0 & 0 & b & 1 \\ 0 & 0 & 1 & b \end{bmatrix} = \begin{bmatrix} A_1 & O \\ O & A_2 \end{bmatrix}$$
, 其中
 $A_1 = \begin{bmatrix} a & 1 \\ 0 & a \end{bmatrix}$,
$$A_2 = \begin{bmatrix} b & 1 \\ 1 & b \end{bmatrix}$$
;

 $B = \begin{bmatrix} a & 0 & 0 & 0 \\ 1 & a & 0 & 0 \\ \hline 0 & 0 & b & 0 \end{bmatrix} = \begin{bmatrix} B_1 & O \\ O & B_2 \end{bmatrix}$, 其中
 $B_1 = \begin{bmatrix} a & 0 \\ 1 & a \end{bmatrix}$,

$$A_1 = \begin{pmatrix} a & 1 \\ 0 & a \end{pmatrix},$$

$$B = \begin{pmatrix} a & 0 & 0 & 0 \\ 1 & a & 0 & 0 \\ \hline 0 & 0 & b & 0 \\ 0 & 0 & 1 & b \end{pmatrix} = \begin{pmatrix} B_1 & O \\ O & B_2 \end{pmatrix}, \quad \sharp \psi \qquad B_1 = \begin{pmatrix} a & 0 \\ 1 & a \end{pmatrix}, \quad B_2 = \begin{pmatrix} b & 0 \\ 1 & b \end{pmatrix};$$

$$A_2 = \begin{pmatrix} b & 1 \\ 1 & b \end{pmatrix};$$

$$B_1 = \begin{pmatrix} a & 0 \\ 1 & a \end{pmatrix},$$

$$\boldsymbol{B}_2 = \begin{pmatrix} \boldsymbol{b} & \boldsymbol{0} \\ 1 & \boldsymbol{b} \end{pmatrix};$$

$$A + B = \begin{pmatrix} A_1 \\ A_2 \end{pmatrix} + \begin{pmatrix} B_1 \\ B_2 \end{pmatrix} = \begin{pmatrix} A_1 + B_1 \\ A_2 + B_2 \end{pmatrix},$$

$$A_1 + B_1 = \begin{pmatrix} a & 1 \\ 0 & a \end{pmatrix} + \begin{pmatrix} a & 0 \\ 1 & a \end{pmatrix} = \begin{pmatrix} 2a & 1 \\ 1 & 2a \end{pmatrix},$$

$$A_2 + B_2 = \begin{pmatrix} b & 1 \\ 1 & b \end{pmatrix} + \begin{pmatrix} b & 0 \\ 1 & b \end{pmatrix} = \begin{pmatrix} 2b & 1 \\ 2 & 2b \end{pmatrix},$$

$$A + B = \begin{pmatrix} 2a & 1 & 0 & 0 \\ 1 & 2a & 0 & 0 \\ 0 & 0 & 2b & 1 \\ 0 & 0 & 2 & 2b \end{pmatrix}.$$

$$A_1 + B_1 = \begin{pmatrix} a & 1 \\ 0 & a \end{pmatrix} + \begin{pmatrix} a & 0 \\ 1 & a \end{pmatrix} = \begin{pmatrix} 2a & 1 \\ 1 & 2a \end{pmatrix},$$

$$A_2 + B_2 = \begin{pmatrix} b & 1 \\ 1 & b \end{pmatrix} + \begin{pmatrix} b & 0 \\ 1 & b \end{pmatrix} = \begin{pmatrix} 2b & 1 \\ 2 & 2b \end{pmatrix},$$

$$\therefore A + B = \begin{bmatrix} 1 & 2a & 0 & 0 \\ 0 & 0 & 2b & 1 \\ 0 & 0 & 2 & 2b \end{bmatrix}$$

$$ABA = \begin{pmatrix} A_1 & \\ & A_2 \end{pmatrix} \begin{pmatrix} B_1 & \\ & B_2 \end{pmatrix} \begin{pmatrix} A_1 & \\ & A_2 \end{pmatrix}$$

$$= \begin{pmatrix} A_1 B_1 A_1 & & \\ & A_2 B_2 A_2 \end{pmatrix},$$

$$A_1B_1A_1 = \begin{pmatrix} a^3 + a & 2a^2 + 1 \\ a^2 & a^3 + a \end{pmatrix}, \quad A_2B_2A_2 = \begin{pmatrix} b^3 + 2b & 2b^2 + 1 \\ 3b^2 & b^3 + 2b \end{pmatrix},$$

$$A_{1}B_{1}A_{1} = \begin{pmatrix} a^{3} + a & 2a^{2} + 1 \\ a^{2} & a^{3} + a \end{pmatrix}, \quad A_{2}B_{2}A_{2} = \begin{pmatrix} b^{3} + a \\ 3b \end{pmatrix}$$

$$\therefore ABA = \begin{pmatrix} a^{3} + a & 2a^{2} + 1 & 0 & 0 \\ a^{2} & a^{3} + a & 0 & 0 \\ 0 & 0 & b^{3} + 2b & 2b^{2} + 1 \\ 0 & 0 & 3b^{2} & b^{3} + 2b \end{pmatrix}.$$

$$\int \mathbf{5} \cdot \mathbf{0}$$

例3 设
$$A = \begin{pmatrix} 5 & 0 & 0 \\ 0 & 3 & 1 \\ 0 & 2 & 1 \end{pmatrix}$$
, 求 A^{-1} .

$$A = \begin{pmatrix} 5 & 0 & 0 \\ 0 & 3 & 1 \\ 0 & 2 & 1 \end{pmatrix} = \begin{pmatrix} A_1 & O \\ O & A_2 \end{pmatrix},$$

$$A_1 = (5), A_1^{-1} = \begin{pmatrix} \frac{1}{5} \end{pmatrix}; A_2 = \begin{pmatrix} 3 & 1 \\ 2 & 1 \end{pmatrix}, A_2^{-1} = \begin{pmatrix} 1 & -1 \\ -2 & 3 \end{pmatrix};$$

$$A^{-1} = \begin{pmatrix} A_1^{-1} & O \\ O & A_2^{-1} \end{pmatrix} = \begin{pmatrix} 1/5 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & -2 & 3 \end{pmatrix}.$$

$$\therefore A^{-1} = \begin{pmatrix} A_1^{-1} & O \\ O & A_2^{-1} \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & -1 \\ 0 & -2 & 3 \end{pmatrix}$$

例4 设分块矩阵
$$A = \begin{pmatrix} B & O \\ C & D \end{pmatrix}$$
,其中 $B = B_{r \times r}, D = D_{s \times s}$ 均为可逆矩阵 解:由拉普拉斯定理知 $|A| = \begin{pmatrix} B & O \\ C & D \end{pmatrix}$ 故 A 可逆.设 A^{-1} 的分块形式为 $A^{-1} = \begin{pmatrix} X & Y \\ Z & T \end{pmatrix}$ 其中, $X = X_{r \times r}, T = T_{s \times s}$

$$B = B_{r \times r}, D = D_{s \times s}$$
 均为可逆矩阵,求 A^{-1} .

解:由拉普拉斯定理知 $|A|= \begin{vmatrix} B & O \\ C & D \end{vmatrix} = |B||D|\neq 0$

故A可逆. 设 A^{-1} 的分块形式为

$$A^{-1} = \begin{pmatrix} X & Y \\ Z & T \end{pmatrix}$$

利用分块乘法有

$$AA^{-1} = \begin{pmatrix} B & O \\ C & D \end{pmatrix} \begin{pmatrix} X & Y \\ Z & T \end{pmatrix}$$
$$= \begin{pmatrix} BX & BY \\ CX + DZ & CY + DT \end{pmatrix} = E = \begin{pmatrix} E_r & O \\ O & E_s \end{pmatrix}$$

$$\begin{cases} BX = E_r \\ BY = O \\ CX + DZ = O \end{cases} \implies \begin{cases} X = B^{-1} \\ Y = O \\ Z = -D^{-1}CB^{-1} \\ T = D^{-1} \end{cases}$$

$$X = B^{-1}$$

$$Y = O$$

$$Z = -D^{-1}CB^{-1}$$

$$T = D^{-1}$$

故

$$A^{-1} = \begin{pmatrix} B^{-1} & O \\ -D^{-1}CB^{-1} & D^{-1} \end{pmatrix}$$

特别的,当 C=O时, $A=\begin{pmatrix} B & O \\ O & D \end{pmatrix}$

$$A^{-1} = \begin{pmatrix} B^{-1} & O \\ O & D^{-1} \end{pmatrix}$$

这与对角形矩阵的结论是一致的.

$$tr(A) = a_{11} + a_{22} + \dots + a_{nn}$$

- \$ 2.5.2 方阵的迹 定义 设 $A = (a_{ij})_{n \times n}$, 则A的迹为 $tr(A) = a_{11} + a_{22} + ... + a_{nn}$ tr(A+B) = tr(A) + tr(B)• $tr(kA) = k \cdot tr(A)$ tr(AB) = tr(BA)• $tr(P^{-1}AP) = tr(A)$ $A = diag(A_1, A_2, \dots, A_s)$ $tr(A) = tr(A_1) + tr(A_2) + tr(A_3)$ • $A = diag(A_1, A_2, \dots, A_s)$, \emptyset $tr(A) = tr(A_1) + tr(A_2) + \cdots + tr(A_s)$
